

Swarm Dashboard Teardown

Two exports of the same screen, caught at two moments of the same run. **One is the dashboard at rest; the other is 2.4 seconds into a run**, at the instant the first agent hands its work to the second. Everything below maps what sits where, and what the second frame is telling you that the first one isn't.

20546eea... — at rest · plate 1

405269c6... — running, 30% · plate 2

1600 × 1000 · light theme · raster, no text layer

Plate 1 — the anatomy, at rest

IDLE · Run #3

Nothing has been dispatched yet. This is the cleanest look at the layout: four regions across the top — swarm, simulated Figma, extraction, delivery — with the progress rail and the console beneath.

1 Top bar

Product title, the `Figma MCP` stack chip, the `MODE: CHANGES` scenario switch, the run-status pill reading **IDLE · Run #3**, and the theme toggle.

3 Agent card anatomy

Every card carries the agent name, its live status, the MCP tool it is bound to (`figma.get_file_versions`), and an activity sparkline. All three read **IDLE** and the sparklines sit near baseline.

5 Layers tree

Five frames. Three already carry a **CHANGED** tag, but none are dimmed to **SKIPPED** — detection has not run, so nothing has been ruled out yet.

7 Extraction output

Empty at rest — **0 SPECS**, “waiting for extraction agent...”, and “no assets yet” in the Exported Asset slot.

9 Self-healing console

0 lines. The stream shows only `// idle · awaiting run`.

11 Run controls

Start Run is live and solid blue, with **Replay** and the **1x / 2x** speed switch beside it.

2 Agent swarm column

The three LangGraph agents, stacked in pipeline order: Change Detection (blue), Extraction (violet), Posting (green). Thin connectors run between them.

4 Simulated Figma window

Fake browser chrome and URL (`figma.com/file/DesignSystem-v2`). Everything inside is scripted — no Figma is ever contacted.

6 Design inspector

The pane the Extraction Agent will later read: auto-layout padding and gap, fill swatches with hex, and typography.

8 Run progress rail

Six checkpoints at 10 / 30 / 50 / 75 / 90 / 100%, all hollow. No status label, because nothing has happened.

10 Learned patterns

Already populated *before* the run — two failures from Run #1 and Run #2, each with its resolution. This is the persistent memory the self-heal later matches against.

The same screen once the Change Detection Agent has finished. Markers here cover only what has come alive — for the static anatomy, see plate 1.

Zoom to full size

1

Status pill flipped

Now **RUNNING · Run #3** in the Figma selection blue. The scenario is still **MODE: CHANGES**.

2

Detection agent active

The Change Detection Agent is ringed in its blue identity glow and reads **HANDING OFF**. Extraction and Posting still read IDLE — this swarm runs strictly in sequence.

3

Handoff packet in flight

The **3 cha...** payload — “3 changed frames” — travelling down the connector from Detection to Extraction. This is the agent-to-agent handoff made visible.

4

Layers tree resolved

Detection's verdict is in: Buttons/Primary, Icons/24px Set and Nav/Top Bar are tagged **CHANGED**; Card/Product and Modal/Confirm are dimmed to **SKIPPED**.

5

Ghost cursor + caption

A synthetic cursor narrates the current action in place: “*inspecting layer: Modal / Confirm*”.

6

Progress at 30%

First two checkpoints ticked. The label reads “Change detection complete · 3 frames changed”.

7

Console, 6 lines

8

Downstream still empty

Timestamped and severity-tagged,
ending at 002.41s with [OK]
change_detection: 3 changed frames
identified.

Extraction Output and Delivery are
unchanged — 0 specs, no asset, no
message. The pipeline simply has not
reached them yet.

9 Control disabled

Start Run has become a greyed-out
Running... for the duration.

WHAT ACTUALLY CHANGED BETWEEN THE TWO FRAMES

SIGNAL	PLATE 1 · AT REST	PLATE 2 · RUNNING
Run status	IDLE · Run #3	RUNNING · Run #3
Active agent	none — all three idle	Change Detection, handing off
Layer verdicts	3 tagged CHANGED, none ruled out	3 CHANGED, 2 dimmed to SKIPPED
Progress	0% · no label	30% · "Change detection complete"
Specs harvested	0	0 — extraction not started
Exported asset	no assets yet	no assets yet
Console	0 lines	6 lines, last at 002.41s
Delivery	bot header only	bot header only
Primary control	Start Run (enabled)	Running... (disabled)

WORTH KNOWING

Plate 2 is an early frame, not a finished run. Detection is the only agent that has done anything. The whole choreography reaches 100% at about 12.4 seconds — so this is roughly the first fifth of it, which is why the entire right-hand column still reads empty.

The learned-patterns panel is populated in both frames. That is deliberate: it is memory carried in from Runs #1 and #2, and the Run #2 entry — the export rate limit — is the one

that gets matched later in this run when the export fails with an HTTP 429.

Both exports already carry this session's edits — a single `Figma MCP` chip in the top bar, and the orbiting-dot logo removed from beside the title.
